

TRAINING REPORT (TR-102)

DAY: -7 (17 JUNE 2024)

IMPLEMENTATION OF INTERNAL CSS: - Internal CSS is a set of style

To use internal CSS, include CSS rules within a <style> tag inside the <head> tag

Syntax: - tag {property: value;}

tag, tag, tag... {property: value;}

The float property specifies whether an element should float to the left, right, or not at all.

There are two types of lists: -

- Ordered list
- Unordered list

Their syntax is list-style-type:

ID's: - Only one element is wanted, or we can say that there is a unique ID, it is defined by #

Class: - Class can be assigned multiple elements on a page, class is defined by.

ID is unique but class is not Unique

The position property specifies the type of positioning method used in an element. In position, it uses the attribute position.

There are five types of positions: -

- Static
- Relative
- Fixed
- Absolute
- Sticky

Display: - Display properly specifies the display behavior.

Syntax : - display:value;

The value can be the following type:

- inline (eg)
- block (eg <p>)
